Item Lists Overview

Item Lists allow you to create a customized list of SKUs, and this list is then used to select the items to include in a particular process or report. You would use item lists when the standard from/to and code selection criteria are not sufficient for selecting the items you want included.

Item Lists can be created from:

- [Item List Maintenance Viewer](#)
- [Modify Item Promotions \(MIP\)](#)
- [True Value Catalog's Item List/Item Analyzer screen](#)
- [True Value Event Viewer](#)
- [Eagle Mobile Item Lists](#)

Item Lists can be used in the following applications:

- Order Point Report (ROP) to calculate order points for the items on the list.
- Suggested Order Report (RSO) to create a PO for the items on the list
- Eagle Mobile Physical Inventory. You can take advantage of the work flow known as [Directed Counts](#), which allows you to assign inventory lists to the stores required to do the count, assign the list to a counter(s), monitor and review the count's progress, and finally reconcile and finalize that count list with RPI.
- Dynamic Promotions (refer to the [online help for Dynamic Promotions](#) for more information)
